

Conception Phase

Project Summary:

This project focuses on building a **feature-rich trading platform** inspired by **Zerodha**, using the **MERN stack** (MongoDB, Express.js, React.js, and Node.js). The primary goal is to simulate a modern online trading experience with responsive design, smooth navigation, and real-time data handling. For development, essential tools such as **Visual Studio Code**, **Git**, **GitHub**, **Node.js**, and testing via **Jest** were utilized. The frontend is developed using React.js along with HTML, CSS, JavaScript, Bootstrap, and Material UI to provide a professional and visually appealing user interface. The backend is powered by Express.js and Node.js, enabling robust server-side operations and API handling. MongoDB is used for the database layer to ensure fast and flexible data storage. The entire system is tested using the Jest framework to maintain high reliability and bug-free performance. For deployment, platforms like **AWS** and Vercel are used to host the application and make it publicly accessible. The GitHub setup ensures version control and collaborative workflow throughout the development cycle. This MERN stack-based trading platform is ideal for users seeking a responsive, scalable, and secure web-based solution for market analysis and investment tracking.
